## 1 CARTOGRAFIA Y TOPOGRAFÍA

Por encargo de la empresa ESTEYCO la empresa GESERTO, S.L., ha realizado los trabajos de campo y de gabinete necesarios para el Contrato de Elaboración de Cartografía en el Ámbito del Proyecto de "P.R Vía – Línea TXORIERRI – Tramo: ZAMIDIO - LEZAMA".

Los trabajos consisten en:

- la implantación de una Red Básica planimétrica y altimétrica de precisión a lo largo de la traza con vértices ubicados como máximo a 2Km. de distancia que servirá de base topográfica a la redacción de los posteriores proyectos y ejecución de las obras
- Ejecución de la cartografía a escala 1/500 con equidistancia de curvas de 0.25 metros

## 2 RED BASICA

### 1.1 CALCULO PLANIMETRIA

Las coordenadas WGS-84 de los Vértices de la RED BASICA, se han obtenido con técnicas GPS, por el método de observación ESTÁTICO RELATIVO, con observaciones de un mínimo de diecisiete minutos de duración, cinco segundos por Época (intervalo de registro de la observación) y una máscara de elevación de los satélites sobre el horizonte de 15º.

El GDOP máximo de cada observación ha sido siempre inferior a 8.

Las cotas ORTOMETRICAS finales de los Vértices de la red básica se han obtenido por medio de nivelación **GEOMETRICA**.

En un principio se proyectó enlazar con la línea de Nivelación de alta precisión 10234 DURANGO\_COLINDRES, que transcurre por la carretera BI-737 (antigua N-637), para lo cual se buscaron las señales SSK-21.200, SSK-22.300, SSK23.300 próximas a la zona del trabajo. Estas señales han desaparecido, al acerar y pavimentar los márgenes de la carretera donde estaban situadas. Por esta circunstancia se tomó como origen de cotas ortométricas la cota ortométrica del Vértice B-9004 obtenida aplicando el modelo de Geoide IBERGEO 2008.

Se ha empleado un nivel automático SPRINTER-150 de la casa LEICA, con lectura de código de barras, con lo que se elimina el error de lectura del operador (ecuación personal). Se ha empleado el sistema del punto medio y se han realizado 6 anillos cerrados de ida y vuelta. Los errores de cierre de estos anillos han sido mínimos y no se ha superado el error kilométrico de 10 raíz c. de K en ninguno de los anillos. La compensación se ha realizado promediando las cotas absolutas corridas, obtenidas de la ida y la vuelta. Como segunda estación de referencia se usó el vértice B-9004. Este vértice se calculó mediante una

observación de tres horas y media de duración con dos referencias, la estación **KAST** antes mencionada y la estación **GERN** también de la red GNSS de EUSKADI.

Una vez calculado el punto principal B-9004 se procedió a calcular todos los demás puntos que conforman la RED BASICA, utilizando siempre como referencias la estación fija GNSS **KAST** y el Vértice B-9004 antes mencionado.

El cálculo se ha realizado con dos frecuencias L1 y L2, en post-proceso, en código y fase, y se han resuelto las ambigüedades de las BASELINEAS en todos los casos.

Las diferencias máximas entre las coordenadas obtenidas para cada vértice en el cálculo han sido del orden de 0.023m. Estos valores obtenidos se han promediado entre sí.

Una vez obtenidas las coordenadas promediadas ETRS-89 Geográficas con cota elipsoídicas de todos los vértices, se procedió a calcular los cierres de los triángulos de las baselíneas de la red de observaciones y posteriormente a ajustar por **mínimos cuadrados** las observaciones de dicha red.

Se aportan los informes correspondientes a estos ajustes, comprobando que las correcciones del ajuste y sus errores son mínimos.

A continuación se han obtenido las coordenadas **UTM ETRS89 HUSO 30**, con cota **Ortométrica**, empleando el Elipsoide **GRS1980** y el modelo de geoide **IBERGEO 2008**.

Estas coordenadas se han obtenido directamente del programa de cálculo GEO-OFFICE de la casa LEICA con el que se han realizado todos los cálculos y ajustes del trabajo.

### 1.2 CALCULO ALTIMETRIA

Las cotas ORTOMETRICAS finales de los Vértices de la red básica se han obtenido por medio de nivelación **GEOMETRICA**.

En un principio se proyectó enlazar con la línea de Nivelación de alta precisión 10234 DURANGO\_COLINDRES, que transcurre por la carretera BI-737 (antigua N-637), para lo cual se buscaron las señales SSK-21.200, SSK-22.300, SSK23.300 próximas a la zona del trabajo. Estas señales han desaparecido, al acerar y pavimentar los márgenes de la carretera donde estaban situadas. Por esta circunstancia se tomó como origen de cotas ortométricas la cota ortométrica del Vértice B-9004 obtenida aplicando el modelo de Geoide IBERGEO 2008.

Se ha empleado un nivel automático SPRINTER-150 de la casa LEICA, con lectura de código de barras, con lo que se elimina el error de lectura del operador (ecuación personal). Se ha empleado el sistema del punto medio y se han realizado 6 anillos cerrados de ida y vuelta. Los errores de cierre de estos anillos han sido mínimos y no se ha superado el error kilométrico de 10 raíz c. de K en ninguno de los anillos. La compensación se ha realizado promediando las cotas absolutas corridas, obtenidas de la ida y la vuelta.

### 3 LEVANTAMIENTOS TOPOGRÁFICOS

Se han realizado varios levantamientos que han consistido en:

- Levantamiento topográfico de la vía, elementos ferroviarios y estaciones a lo largo y ancho de la zona de ejecución de los trabajos.

#### 1.3 APARATOS EMPLEADOS Y OBSERVACION

Se han utilizado dos receptores de doble frecuencia marca LEICA, SYSTEM 530 y 1200, para trabajos RTK (Real Time Kinematic), con la siguiente configuración:

- Mínimo número de satélites..... 4
- Máscara de observación..... 10°
- Calidad mínima de observación..... 5cm

Además, no se observarán puntos en el campo con un GDOP (precisión en el posicionamiento) superior a 5.

La toma de datos es en tiempo real (RTK), con lo que el tiempo invertido en tomar cada punto es de 1 a 3 segundos, ya que se toma con la configuración de "tomar puntos por precisión" y no "por posición" con lo que la toma de datos es instantánea.

Para la realización de estos trabajos unimos con la red de estaciones permanentes de EUSKADI .

El objetivo de la red RTK es reducir al mínimo la influencia de los errores dependientes de distancia para los equipos móviles que calculan su posición dentro de los límites de la red. El software de servidor de red RTK comienza este proceso por:

Fijar las ambigüedades de los satélites dentro de la red.

Usar los datos de todas (o un subconjunto de) las estaciones para generar las correcciones de referencia que se envían al móvil.

#### 1.4 CALCULOS

La medición de los puntos se ejecuta inicialmente en el sistema de coordenadas WGS-84 para luego aplicarle el sistema ETRS89 con proyección UTM, y para la altura ortométrica le aplicamos el modelo de geoide "GRS1980" y el modelo de geoide "IBERGEO 2008", y esto se hace con el software de Leica LGO (Leica Geo Office).
